

TenderIQ

Find the tenders your company can actually pursue.

An AI-assisted public tender discovery and bid-fit platform for organizations competing for public-sector work in Pakistan.

DISCOVER

Find relevant opportunities

ASSESS

Surface fit and possible gaps

PREPARE

Focus effort before deadlines

Prepared as an initial product proposal

01 / The opportunity

Public procurement notices are spread across portals and documents. A company may find a tender but still spend significant time deciding whether it fits, which eligibility requirements matter, and what evidence it needs to prepare. TenderIQ is designed to make that first decision faster and clearer.

The product question

Which tenders are relevant to our company, and what should we verify before investing time in a bid?

Proposed solution

TenderIQ maintains a company profile, presents procurement opportunities in one searchable workspace, and compares tender language with the company's stated services, experience, certifications, and past projects. It gives a preliminary fit score with the reasons and gaps visible, so a person can decide what to investigate in the official tender documents.

Who it serves

SMALL AND MID-SIZE BUSINESSES	Consultancies and service firms	BID AND BUSINESS TEAMS
Organizations without a dedicated procurement research team.	Technology, engineering, training, and other firms looking for suitable public work.	People who need a shared view of deadlines, fit, and missing evidence.

Product value

VALUE	WHAT THE USER GETS
Less manual searching	Search and filter notices by keyword, category, status, and deadline.
Earlier qualification	See a first-pass comparison against company capabilities before committing bid effort.
More focused preparation	Review tender requirements and profile gaps in one place.

02 / MVP scope

The initial build establishes the product foundation and a usable demonstration. It uses sample procurement data so the experience can be explored before a live source integration is selected.

MVP CAPABILITY	INCLUDED BEHAVIOR
Opportunity dashboard	Search and filter sample tenders. Review organizations, categories, locations, deadlines, and estimated values.
Company profile	Store services, industry, location, years of experience, employee count, turnover, certifications, and past projects.
Preliminary fit analysis	Compare tender wording with profile information. Show a score, matching strengths, potential gaps, and a clear review caveat.
Tender detail view	Inspect the summary, procurement method, deadline, key requirements, and company-fit analysis.
API and data storage	Use FastAPI endpoints for tender and profile data, with MongoDB persistence when a database is configured.
Procurement source boundary	Keep ingestion separate from the dashboard and matching logic so EPADS or another source can be added later.

User workflow

1	2	3	4
Create company profile	Browse relevant tenders	Review fit and gaps	Verify official documents

Current product limits

The demo does not scrape EPADS or other live sources. Fit results come from a deterministic rules-based service and are not legal, financial, or procurement advice. Sample notices are illustrative. Users must confirm dates, eligibility, and submission requirements against the official notice and bidding documents.

03 / Implementation approach

The codebase separates the user interface, API routes, business services, repositories, and future source adapters. This supports replacing demo data and the initial analysis logic without redesigning the full product.

LAYER	MVP CHOICE	RESPONSIBILITY
Frontend	React + TypeScript	Dashboard, filters, profile editing, and tender details.
API	FastAPI + Pydantic	Typed endpoints and input validation for tenders and company profiles.
Persistence	MongoDB	Store tender, company, and analysis records; demo fallback supports local exploration.
Analysis	Analysis service interface	Start with explainable rules; allow a reviewed AI provider to be added later.
Ingestion	Adapter boundary	Add source-specific collection, parsing, deduplication, and update jobs in a later phase.

Suggested delivery phases

Phase 1 - MVP foundation

Complete the dashboard, company profile, API, MongoDB integration, demo tender set, and rules-based analysis.

Phase 2 - Source ingestion

Select procurement sources, confirm access and permitted use, then build resilient adapters with monitoring and deduplication.

Phase 3 - Document intelligence

Extract deadlines, eligibility, required documents, and evaluation criteria from tender files, with source references and human review.

Phase 4 - Team readiness

Add authentication, organization workspaces, saved tenders, bid tracking, alerts, and audit history.

Measures of early success

A pilot should measure time to identify a relevant opportunity, the share of displayed tenders users consider relevant, how often users act on a match, and whether listed requirements help teams spot missing evidence earlier. These measures should be collected with user consent and reviewed before making product claims.

Decision requested

Confirm the initial target user group and the first procurement source to support. Those choices will shape ingestion priorities, matching criteria, and the next product phase.
